This is **DAY 4** of the *AI Creator Series*

Buttery Slow-Motion With AI

★ The Core Idea: Control The Speed Curve:

- The trick is to think like an editor controlling a speed curve — the footage runs at full speed, dramatically drops to slow motion right at the impact beat, then ramps back to normal. That contrast is what makes it feel cinematic instead of sluggish.

## ★ THE SPEED-RAMP PROMPT STRUCTURE:

## ✓ THE STRUCTURE :

[Your scene plays out at normal speed] ... just as [THE EXACT TRIGGER MOMENT], the speed dramatically ramps to [X]% slow motion, [CAMERA MOTION that sells the beat] ... then the speed ramps back to normal [as the action continues].

## ✓ EXAMPLE PROMPT:

<<<image\_1>>> is the reference for the location, the runner, the art style and the lighting for the entire video. He is the only person on the track.

One-sentence summary: A lone sprinter drives off the line and runs down an empty track under hard midday sun, live-action premium sportswear commercial style, three shots ramping from full speed into extreme slow motion and back at the finish.

## [Subject]

The man from <<<image\_1>>>. Lean, powerfully built young runner, short hair, deeply tanned. He wears a cropped black-blue patterned sleeveless running vest, black running shorts, low black ankle socks, a sports watch on his left wrist, and neon volt-yellow racing shoes with a thin white stripe along the sole. Total focus, no expression. Total focus, teeth set, driving hard.

## [Environment]

A red rubberized outdoor running track with crisp white lane lines running away toward the horizon. Green grass infield, a tall dense treeline of deciduous and pine behind, white goalpost uprights, a thin flagpole, a low metal fence. Clear teal-blue sky.

## [Lighting]

Harsh high midday sun, hard-edged short shadows on the track surface, bright specular highlights on skin, sweat and the neon shoes. Strong natural contrast, no fill.

## [Style]

Live-action cinematic film, shot on 35mm, organic film grain, shallow depth of field on a long lens, gentle halation on highlights, muted cool grade with warm red track against teal sky. Photographic realism throughout.

## [Shot list — 10 seconds, 3 shots]

0-3s: **Normal speed.** Extreme low shot at ground level, camera pressed to the track surface, framed tight on the neon shoes set in a coiled starting stance across the white lane line. The camera pushes slowly in. He rocks his weight forward, the shoe soles flex and grip, and he explodes off the line — the rear foot driving hard, track grit spitting up. The camera drops back fast as the feet slam past close over the lens. At the 3-second mark a speed ramp begins.

**Speed ramp down into slow motion at the 3-second mark.**

3-7s: **Extreme slow motion, roughly 10% speed.** Two full stride cycles stretched across the whole segment. Lateral trucking shot from the side, camera moving at normal speed and holding him locked in centre frame at mid-body height as the lane lines and treeline streak past behind him. Every detail reads: the shoe sole compressing and rebounding off the track, the drive knee rising, quads and calves flexing under the skin, sweat droplets flung from his jaw and shoulders hanging suspended in the air, the singlet rippling, arms cutting through in long controlled arcs. Foreground lane lines flick past close and out of focus.

**Speed ramp back up to normal at the 7-second mark.**

7-10s: Extreme close-up on his face, camera travelling backward in front of him at his own speed. **The speed ramps rapidly back to full** — his breathing hits real time, chest heaving, mouth open and gasping, sweat running down his temples and jaw, sunglasses catching the sky. He grits his teeth and drives the last strides. The camera pulls back and rises fast as he crosses the painted finish line alone on the empty track, then slows to a walk with his hands on his head, still gasping. Final frame holds wide on him standing alone in the lane.

## [Overall requirements]

Vertical 9:16 frame. Consistent grade, grain and lens character across all three shots. Kinetic camera movement throughout — every shot carries a distinct move. The slow-motion section must read as genuine high-frame-rate slow motion: crisp and sharp with suspended sweat droplets and grit, not blurred or smeared. Correct running biomechanics, stable anatomy, no warping of the limbs or shoes. High detail throughout.

Natural environmental audio only: shoe strikes on the rubber track, hard breathing dropping into a low stretched drone through the slow-motion section then snapping back to fast ragged panting, wind, distant birds. No BGM. No subtitles.

## [Strictly exclude]

Animation, illustration, painterly texture, 3D CG render, video game look, additional runners, spectators or people on the field, text, lettering, logos or watermarks, letterboxing or black bars, motion blur during the slow-motion section.

## ★ THE EXACT TOPAZ SETTINGS:

- ★ They also save you \$cost in ai video generation as you can generate in 720p and then upscale it to 1080p
- These setting are best for social media uploads, like for instagram, that I use.
- Meaning if you want the best quality after uploading your reel on instagram then select 30FPS & 1080p. (cz insta ultimately doesnt support beyond that and this insure that we dont loose much after upload)
- For other purpose you can select 2k/4K | 60FPS+ | ~80 bitrate quality

## THE SMART STRATEGY:

Slow motion isn't a setting you switch on — it's a moment you design. The pros don't slow the footage; they draw a speed curve and then smooth it. Learn to place the ramp and interpolate the frames, and any action shot you generate turns into a moment people rewind three times.
